

3001116.1 / 30012599.002

29 March 2019

Savills Australia Stephanie Ballango Level 25, Governor Phillip Tower 1 Farrer Place, Sydney NSW 2000

Dear Stephanie,

### RE: Review of Water and Wastewater Servicing Strategies for the North Tuncurry Development Project

SMEC Australia Pty Ltd (SMEC) was commissioned by UrbanGrowth NSW, now Landcom, to develop the Water and Wastewater Servicing Strategies for a proposed new development at North Tuncurry known as the North Tuncurry Development Project (NTDP). Reports documenting the results of these investigations, which were finalised in 2014, are appended to this letter. Since 2014 several changes have occurred, including:

- The development Master Plan has been updated (copy attached);
- UrbanGrowth NSW, is now known as Landcom; and
- MidCoast Water (MCW), is now MidCoast Water Services (MCWS) part of MidCoast Council.

The purpose of this letter is to outline the status of the 2014 Water and Wastewater Servicing Strategies and to confirm their overall suitability to support development approval for the proposed development.

### Water Servicing Strategy

A review of the key design considerations for the Water Servicing Strategy is summarised in the table below.

ITEM	CURRENT STATUS OF REPORT	CONCLUSION
Development Density	The expected Equivalent Tenement (ET) load for the development is marginally higher than documented in the 2014 report due to the change in the masterplan.	The increase is marginal and does not affect the overall servicing strategy or serviceability of the proposed development.
Water Demands	The demands applied in the 2014 report were in accordance with the MCW Design Manual, which was applicable at the time. Written advice from MCWS has confirmed that these guidelines are still current (see attached letter from MCWS).	No change to the serviceability.

SMEC 74 Hunter Street Newcastle, NSW 2300, Australia (PO Box 1346, Newcastle, NSW 2300, Australia) T +61 2 4925 9600 F +61 2 4925 3888 E newcastle@smec.com www.smec.com

SMEC Australia Pty Ltd **ABN** 47 065 475 149 SMEC International Pty Ltd **ABN** 32 065 440 619 SMEC Services Pty Ltd **ABN** 79 066 504 792 SMEC Holdings Pty Ltd **ABN** 84 057 274 049

ITEM	CURRENT STATUS OF REPORT	CONCLUSION
Water Servicing - Trunk	It is proposed that the NTDP will be serviced as part of the Manning Water supply system, connecting to a DN600 DICL water main located on Lakes Way.	Given the marginal change in development density this connection is still considered suitable.
Water Servicing - Internal	The preliminary layout and sizing of the internal water mains are based on the previous masterplan.	Updates to the masterplan will affect the internal layout. However, this will not affect the serviceability of the development.

### Wastewater Servicing Strategy

A review of the key design considerations for the Wasterwater Servicing Strategy is summarised in the table below.

ITEM	CURRENT STATUS OF REPORT	CONCLUSION
Development Density	The expected ET load for the development is marginally higher than documented in the 2014 report due to the change in the masterplan.	The increase is marginal and does not affect the overall servicing strategy or serviceability of the proposed development.
Sewer Loadings	The loadings applied in the 2014 report were in accordance with the MCW Design Manual, which was applicable at the time. Written advice from MCWS has confirmed that these guidelines are still current (see attached letter from MCWS).	No change to the serviceability.
Wastewater Servicing Strategy – Reticulation System	Two servicing options were considered for NTDP in the 2014 report; Gravity Sewerage System and Vacuum Sewerage System. This is still consistent with MCWS's expectation for the development, as outlined in the Hallidays Point Sewerage Scheme – Servicing Strategy (2016). A gravity reticulation sewerage system is preferable for the NTDP. The preliminary layout of the internal systems are based on the previous masterplan.	The assessment of these systems is still valid, with minimal changes due to the marginal change in load. Updates to the masterplan will also have a minimal effect on the internal layout. Overall these changes will not affect the serviceability of the development.

ITEM	CURRENT STATUS OF REPORT	CONCLUSION
Wastewater Servicing Strategy – Trunk Main	The NTDP is included in the catchment for the Hallidays Point Wastewater Treatment Plant (WWTP), with several options considered for transferring flows to the WWTP. These options are consistent with MCWS's expectation for the development, as outlined in the Hallidays Point Sewerage Scheme – Servicing Strategy (2016).	Given the marginal change in development loads this strategy is still considered suitable.
Servicing the Initial Stages of the Development	The initial stages of the development will be serviced via the Tuncurry No. 22 WWPS. This is consistent with the Hallidays Point Sewerage Scheme – Servicing Strategy (2016).	Changes to the masterplan may affect how many stages can be serviced via this WWPS. However, this will not affect the overall serviceability of the development.

### Summary

In summary, while the 2014 Water and Wastewater Servicing Strategies will need to be updated as the development design is progressed, they are considered suitable for planning purposes and to support any necessary approvals.

Yours sincerely,

War

Marlène van der Sterren Team Leader – Water Resources

17 October 2014

UrbanGrowth NSW PO Box 718 Forster NSW 2428

Attention: Michael Pring

Dear Michael,

RE: North Tuncurry Development Project Water Servicing Study

## **1 INTRODUCTION**

UrbanGrowth NSW has commissioned SMEC Australia Pty Ltd (SMEC) to undertake water servicing investigations for a new development in North Tuncurry.

The North Tuncurry Development Project (NTDP) involves the re-zoning and subdivision of a 615 ha site north of Tuncurry on the mid north coast of New South Wales (the Site). Refer locality plan on **Figure 1**.

It is the intention of UrbanGrowth NSW to develop the site in stages for a mix of land uses, including residential dwellings, employment land, retail and open space.

This study has been prepared to define the water servicing strategy for the new development and includes investigation of the following elements:

- Development description, refer **Section** 2.
- Study area (the natural catchment boundaries, topography, environmental conservation constraints etc.), refer **Section 3**.
- Planning context (references to Local Environmental Plan, development consent), refer Section 4.
- Preliminary water demand estimation, refer Section 5.
- Details of connection to the existing water supply system, refer Section 6.
- Preliminary water reticulation design, refer Section 7.
- Preliminary cost estimates, refer Section 8.
- Conclusion, refer Section 9.

1

## 2 DEVELOPMENT DESCRIPTION

UrbanGrowth NSW are proposing to deliver a mixed use development on the Site that meet's the NSW State Government's objectives to increase housing supply, provide community benefits and create jobs<sup>1</sup>.

The NTDP specifically incorporates the following components<sup>1</sup>:

- the type and location of land uses within the site;
- dwelling yield / density (approximately 2,123 dwellings);
- proposed location of retail / commercial / community floor space within the site;
- identification and location of open space and drainage, environmental conservation lands, and local active and passive recreation facilities;
- transport network layout;
- utilities (including power, telecommunications and gas), infrastructure strategy, potable water strategy, sewer concept plan and water cycle management plan;
- location and dimensions of Bushfire Asset Protection Zones;
- appropriate conservation of European and Aboriginal heritage located on the site.

It is estimated that the site will be developed over thirty years. The stages of the residential development will proceed from the south to the north-west, then to the north and to the south-east. Stages E1 and E2 are employment land stages which will only be developed as demand emerges. The proposed Master Plan is shown on **Figure 2**.

<sup>1</sup> JBA –urban development services, (2014), "North Tuncurry Development Project Assessment Report"

## 3 STUDY AREA

The study area covers the 615 ha development site located north of Tuncurry on the mid north coast of New South Wales, refer **Figure 1**.

The study area is relatively flat and located within a rural landscape with a moderately dense coverage of small trees and costal scrub.

The site is bounded by:

- The Lakes Way road to the west;
- undeveloped bushland and the low density residential zone to the south;
- undeveloped bushland and Nature Reserve to the north; and
- Nine Mile Beach to the east.

The proposed finished surface level of the final development is at approximately RL 4 - 6m AHD.

Under developed conditions, typical groundwater levels are expected to range between 1.4 to 2.5m AHD, with the 100 year ARI groundwater level being approximately 4 to 5m AHD across the site. Note that the ground water level will vary across the site. The design philosophy adopted in this early stage of the project is to minimise the potential effects of groundwater levels (up to and including the 100 year ARI event) on the proposed development.

## 4 PLANNING CONTEXT

The proposed works are located within the Great Lakes Local Government Area (LGA).

The relevant environmental planning instrument is the Great Lakes Local Environmental Plan, 2014.

According to this plan, construction of public water infrastructure does not require local government consent. However, consultation with the local government is to be undertaken during the concept design stage.

## 5 WATER DEMANDS

The water servicing study is based on the NTDP Master Plan developed by UrbanGrowth NSW shown on **Figure 2**.

**Table 5-1** provides a breakdown of proposed ultimate equivalent tenements (ETs). There is a small component of employment land loading, but the loadings are dominated by the residential dwellings. A nominal allocation has been made for the employment lots based on consultation with UrbanGrowth and on previous experience on similar projects.

### Table 5-1 – Equivalent Tenements

	Equivalent Tenements (ET)
Residential Lots	2,123
Non-Residential Lots:	
(comprising Employment Area E1 and Employment	00 (51) + 00 (52) - 180
Area EZ North of Stage 1)	90 (E1) + 90 (E2) = 180
TOTAL	2,303 ET

**Table 5-2** summarises water demands calculated in accordance with the MidCoast Water (MCW) DesignManual for the development site.

### Table 5-2 – Conventional water design flows

Equivalent Tenements ET	Peak Day Demand PDD (L/s)	Peak Insta Demand PID ( Mai	ntaneous 'L/s) - Trunk ns	Peak Instantaneous Demand PID (L/s) - Reticulation Mains
2303	74.6	23	D	276
Peak Instantaneous D	emand	PID (L/s) =	0.10 (L/s/ET) Mains)	x 2303 ET = 230 L/s (Trunk
		PID (L/s) =	0.12 (L/s/ET) Mains)	x 2303 ET = 276 L/s (Reticulation
Peak Day Demand		PDD (L/s) =	2800 (L/day/ = 74.6 L/s	ET) x 2303 ET = 6.448 x 10 <sup>6</sup> L/day

## **6 WATER SERVICING - TRUNK**

The NTDP will be serviced as part of the Manning Water supply system.

The NTDP will be serviced from a 4.5ML reservoir north of Tuncurry at Rainbow Flat. The Reservoir has a twothirds Top Water Level (TWL) of 74.7 metres AHD. Assuming friction losses of 3m/km in trunk mains, this leaves a residual pressure at the site of approximately 30 metres, which is compliant with the MCW Design Manual (MCW Design Manual requires a desirable minimum pressure head of 20 metres for domestic applications which is achievable with the above residual pressure at the site boundary).

MCW has previously indicated that the DN600 DICL water main located along the Lakes Way has sufficient capacity to supply the NTDP.

At this stage SMEC understands that staging of the development will proceed from the south to the north. Therefore, the water connection would logically be constructed near the southern portion of the development. The proposed water main would then most likely run from the existing water main located on the eastern side of Manning Street across the road and along Northern Parkway.

If required, a second connection could be constructed to increase the security of supply at a later stage of the development. This main would most likely connect the northern portion of the development site to the existing DN600 water main running along the Lakes Way.

The proposed water connections are shown on Figure 3.

For the purpose of this study a preliminary sizing has been undertaken, refer **Table 6-1**.

### Table 6-1 – Water Main Connection

ET	Preliminary Pipe Size	Approximate Pipe Length
Connection 1	DN450	400 m
Connection 2	DN450	450 m

## 7 WATER SERVICING - INTERNAL

For the purpose of this study a preliminary sizing of water mains has been undertaken and is included in **Appendix B**. The preliminary design of the reticulation water system consists of DN100-DN300 main and is shown on **Figure 3**.

Water mains will be sized more accurately during the concept design stage of the development.

## 8 PRELIMINARY COST ESTIMATES

A preliminary capital cost estimate is included in Appendix A and summarised in Table 8-1.

### Table 8-1 – Preliminary Cost Estimate

Project Size	Preliminary Capital Cost	Cost / ET
2303 ET	\$5.9 M	\$2.6 K

Note:

The cost estimates within this study are based on the Hunter Water Cost Estimating Manual. Use of a common estimating framework allows for cost estimates to be compared between options, but cost estimates cannot be guaranteed as SMEC has no control over contractor's prices, market forces and competitive bids from tenderers. The cost estimates may exclude items which should be considered in a cost plan. Cost estimates are not to be relied upon in any way. If reliable cost estimates are required, then an appropriately qualified Quantity Surveyor should be engaged.

## 9 CONCLUSION

The North Tuncurry Development Project is to be serviced as part of the Manning Water supply system. The NTDP will be serviced from a 4.5ML reservoir north of Tuncurry at Rainbow Flat.

MidCoast Waster has indicated that the DN600 DICL water main located along The Lakes Way has a capacity to supply the NTDP.

Two DN450 connections to the existing water main have been proposed. Initial stages of the development would be supplied from the connection constructed near the southern portion of the development site.

A second connection could be constructed to increase the security of supply at a later stage of the development. This main would connect the northern portion of the development site to the existing DN600 water main running along The Lakes Way.

Based on a preliminary assessment, the water reticulation system would consist of DN150 to DN300 mains.

A preliminary capital cost estimate of \$5.9M (\$2.6K per ET) utilising the Hunter Water Cost Estimating Manual has been developed.

30 October 2014

UrbanGrowth NSW PO Box 718 Forster NSW 2428

Attention: Michael Pring

Dear Michael,

RE: North Tuncurry Development Project - Wastewater Servicing Study

## **1 INTRODUCTION**

UrbanGrowth NSW has commissioned SMEC Australia Pty Ltd (SMEC) to undertake wastewater servicing investigations for a new development in North Tuncurry.

The North Tuncurry Development Project (NTDP) involves the re-zoning and subdivision of a 615 ha project site north of Tuncurry on the mid north coast of New South Wales (the Site). Refer locality plan on **Figure 1**.

It is the intention of UrbanGrowth NSW to develop the site in stages for a mix of land uses, including residential dwellings, employment land, retail and open space.

This study has been prepared to define the wastewater servicing strategy for the new development and includes investigation of the following elements:

- Development description, refer Section 2.
- Study area (the natural catchment boundaries, topography, environmental conservation constraints etc.), refer **Section 3**.
- Planning context (references to Local Environmental Plan, development consent), refer Section 4.
- Identification of the options for the wastewater reticulation design, refer Section 5.
- Identification of the trunk main options, assessment of downstream capacity in MidCoast Water's sewerage system and details of any upgrades required. Refer **Section 6**.
- Options Assessment, refer Section 7.
- Identification of the options for servicing the initial stages of the development, refer Section 8.
- Conclusion, refer **Section 9**.

SMEC Holdings Ltd ABN 84 057 274 049 SMEC Operations Pty Ltd ABN 68 065 474 428 SMEC International Pty Ltd ABN 32 065 440 619 SMEC Australia Pty Ltd ABN 47 065 475 149 SMEC Services Pty Ltd ABN 79 066 504 792 1

## 2 DEVELOPMENT DESCRIPTION

UrbanGrowth NSW are proposing to deliver a mixed use development on the site that meet's the State Government's objectives to increase housing supply, provide community benefits and create jobs<sup>1</sup>.

The NTDP will be located within a 261.6ha development area that comprises the following key components<sup>1</sup>:

- Approximately 2,123 residential dwellings.
- 13.2ha of employment lands.
- 9.6ha of parks and open space.
- A village centre.
- Reconfiguration of the existing North Tuncurry Golf Course (total area 59ha).
- Water management infrastructure, including 18.1ha of water management basins.

It is estimated that the site will be developed over thirty years. The stages of the residential development will proceed from the south to the north-west, then to the north and to the south-east. Stages E1 and E2 are employment land stages which will only be developed as demand emerges. The proposed Master Plan is shown on **Figure 2**.

<sup>1</sup> JBA –urban development services, (2014), "North Tuncurry Development Project Assessment Report"

## 3 STUDY AREA

The study area covers the 615 ha project site including the wastewater trunk main sites. The study area is relatively flat located within a rural landscape with a moderately dense coverage of small trees and coastal scrub.

The project site is located north of Tuncurry on the mid north coast of New South Wales, refer Figure 1.

The site is bounded by:

- The Lakes Way road to the west;
- undeveloped bushland and a low density residential zone to the south;
- undeveloped bushland and Nature Reserve to the north; and
- Nine Mile Beach to the east.

The trunk main will transport wastewater from the site to the existing MidCoast Water wastewater system. Three options for the trunk main alignment have been investigated and are detailed in **Section** 6 and on **Figure 7**. The wastewater trunk main study area extends from the township of Tuncurry along The Lakes Way and the access road to the Hallidays Point Wastewater Treatment Plant (WWTP).

## **4 PLANNING CONTEXT**

A majority of the proposed works are located within the Great Lakes Local Government Area (LGA). Only Option 1 that includes a rising main transporting wastewater from the NTDP to Hallidays Point WWTP would be located in both the Great Lakes LGA and the Greater Taree LGA.

The relevant environmental planning instruments are the Great Lakes Local Environmental Plan, 2014 and the Greater Taree LEP, 2010.

According to these plans, construction of public wastewater infrastructure does not require local government consent. However, consultation with the local government bodies is to be undertaken during the concept design stage.

## 5 WASTEWATER SERVICING STRATEGY – RETICULATION SYSTEM

## 5.1 Development Site

The finished surface level of the final development is at approximately RL 4 - 6m AHD.

Under developed conditions, typical groundwater levels are expected to range between 1.4 to 2.5m AHD, with the 100 year ARI groundwater level being approximately 4 to 5m AHD across the site. The site water management philosophy adopted for the project is to minimise the potential effects of groundwater levels (up to and including the 100 year ARI event) on the proposed development.

## 5.2 Servicing Options

There are two technology options currently being considered for the NTDP, being conventional gravity sewers and vacuum sewers.

It is noted that there are other technology options to provide wastewater service to the site, including onsite treatment and pressure sewers, but preliminary negotiations with MidCoast Water have indicated that these are not favoured at the North Tuncurry site due to a variety of technical, environmental, legislative and cost factors.

## 5.2.1 Gravity Sewerage System

A conventional gravity sewerage system consists of a reticulated pipe network, which transports sewage via gravity flow in the reticulation pipes. In a 'typical' subdivision, it provides the highest level of service with the minimum ongoing costs and is the most widely used technology in Australia.

Conventional sewerage reticulation pipework is a minimum 150mm diameter. The pipes are laid with a downhill grade that promote minimum self-cleaning flows for the transport of sewage solids. For maintenance purposes a conventional sewerage system has access manholes at approximately a 120 metres spacing and at changes of grade or direction.

A conventional gravity system may be coupled with a pumped transfer system to deliver sewage to another downstream sewerage system or to a centralised treatment works. The need for pumping depends mainly on site topography and the location of the sewage treatment works.

## 5.2.2 Vacuum Sewerage System

A vacuum sewerage system consists of a reticulated pipe network, which transports sewage from vacuum collection chambers to a vacuum pumping station. It provides a high level of service but with some ongoing maintenance requirements.

Wastewater from each property gravitates to a collection chamber. The collection chamber consists of a storage chamber for sewage and a special vacuum valve. When the level of sewage fills the chamber a sensor opens the vacuum valve and the sewage is admitted into the vacuum sewerage reticulation pipework.

Vacuum sewerage reticulation pipework is of a minimum 80mm diameter. The reticulation pipework is airtight to maintain a vacuum in the reticulation system. The pipes are laid with a downhill grade with vertical risers to minimise depth of the reticulation and provide a 'sawtooth' profile which assists with moving the sewage through the reticulation in short 'bursts' as vacuum valves open and close. This profile provides flexibility to avoid obstacles, without the need for deep excavations or lift pump stations.

The vacuum sewerage system does not have access manholes. The 'sawtooth' profile keeps sewer lines shallow and is designed to ensure that sewage will not block the pipe at low flow periods when the sewage is at rest.

### 5.3 Loadings

The wastewater servicing study is based on the NTDP Master Plan developed by UrbanGrowth NSW as shown on **Figure 2**.

**Table 5-1** provides a breakdown of the proposed ultimate sewer loading. There is a small component of employment land loading, but the loads are dominated by the residential component. A nominal allocation has been made for the employment lots.

### Table 5-1 –Sewer Loading

	Sewer Loading (ET)
Residential Lots	2,123
Non-Residential Lots (comprising Employment Area E1 and Employment Area E2 North of Stage T)	90 (E1) + 90 (E2) = 180
TOTAL	2,303 ET

Different technologies have different potential for groundwater / storm water ingress to the system, resulting in different design flows. Design flows for the technologies considered are detailed in **Sections 5.3.1 and 5.3.2**.

## 5.3.1 Option A – Gravity Sewerage System

Conventional gravity sewerage system loadings for the NTDP have been estimated in accordance with the MidCoast Water Design Manual, as summarised below.

Average Dry Weather Flow	ADWF =	0.005 L/s/ET
Peaking Factor	r =	$\sqrt{1.74 + \frac{56}{ET^{0.4}}}$
Peak Dry Weather Flow	PDWF =	r x ADWF
Storm Allowance	SA =	0.029 L/s/ET (Sandy areas, including Tuncurry)
Peak Wet Weather Flow	PWWF =	PDWF + SA

Design flows calculated using the above parameters are summarised below in Table 5-2.

Table 5-2 – Conventional wastewater design flows (per MCW Design Manual) – Coastal	Permanent

## 5.3.2 Option B – Vacuum Sewerage System

Design flow rates for a vacuum sewerage system have been calculated using a similar methodology to the conventional gravity flows, but with a lower storm allowance.

The potential for storm water ingress is greatly reduced with this system, as it is airtight and being shallower is more likely to be above the groundwater table. As the system is designed to be airtight (and watertight) it will not function if there is a leak. The affected collection chambers will not empty and will trigger a maintenance call from the Water Authority. As such, the potential for stormwater / groundwater ingress into the system is greatly reduced (SA = 0.012 L/s/ET).

Design flows calculated using the above parameters are summarised below in Table 5-3.

Table 5-3 –Vacuum wastewater design flows

### 5.4 Preliminary Wastewater Reticulation Design

The preliminary wastewater system design has been based on the site Master Plan (see Figure 2) and is described in Sections 5.4.1 and 5.4.2. The options assessment is included in Section 7.

## 5.4.1 Option A – Gravity Sewerage System

Based on the available topographic survey and bulk earthworks design prepared by SMEC, the development site has been divided into six catchment areas. The gravity sewerage system in each catchment area would drain into its own internal wastewater pumping station (WWPS). Ultimately, there would be a system of six internal WWPSs transporting flow via rising mains and gravity mains into a Central WWPS.

The Central WWPS would be constructed during Stage A in the southern portion of the development site.

The Central WWPS would transport wastewater from the development site into the MidCoast Water wastewater system.

The Option A preliminary wastewater system layout is shown on Figures 3 and 4.

Until Stage Y is constructed, the detention time of the pumped system would be longer than 4 hours. As a result odour control will be required.

## 5.4.2 Option B – Vacuum Sewerage System

Wastewater from each property would gravitate to a collection chamber. When the collection chamber sump fills to a pre-determined level, an automatic pneumatically operated vacuum interface valve opens. Pneumatic pressure forces the wastewater from the collection chamber into collection lines.

A series of pipes connect each of the chambers to the Central Vacuum Pumping Station. The Vacuum Station would have duty and standby vacuum pumps that create a vacuum in the vacuum sewer lines and an enclosed collection tank. When the vacuum mains deliver sewage and air to the pump station, sewage pumps would then transfer the sewage from the collection tank through a rising main to the existing MidCoast Water wastewater infrastructure.

30011196 - wastewater servicing study - 2014-rev 1\_final | 30 October 2014

The initial ten stages of the development (833 ET) would be serviced by a temporary skid mounted vacuum pumping station. The vacuum pumping station would be constructed during Stage A. The Option B initial wastewater system layout is shown on **Figure 5**.

As the development proceeds, the temporary vacuum pumping station would be replaced by a permanent station. The Option B ultimate wastewater system layout is shown on **Figure 6**.

Until Stage Y is constructed, the detention time in the system would be longer than 4 hours. As a result, odour control will be required.

## **6 WASTEWATER SERVICING STRATEGY – TRUNK MAIN**

### 6.1 Loadings

The ultimate wastewater loadings summarised in **Table 6-1** have been adopted for design of the infrastructure.

### Table 6-1 – Wastewater Loadings

Option	Equivalent Average Dry Tenements Weather Flow ET ADWF (L/s)		Peak Dry Weather Flow PDWF (L/s)	Storm Allowance SA (L/s)	Peak Weather Flow PWWF (L/s)
Option A – Gravity System	2303	11.5	38.8	66.8	105.6
Option B – Vacuum System	2303	11.5	38.8	27.6	66.5

## 6.2 **Options**

Existing MidCoast Water wastewater infrastructure located in proximity to the development site is listed in **Table 6-2**. It includes the Hallidays Point Wastewater Treatment Plant (WWTP) and the Tuncurry No. 23 WWPS and rising main.

Table 6-2 – MidCoast Water Wastewater Infrastructure

Item	Spare Capacity	Distance from the site
Hallidays Point WWTP	Could accept the ultimate flow	11 km from the northern boundary
<b>Tuncurry No. 23 WWPS</b> transporting wastewater to Hallidays Point WWTP	Could accept the ultimate flow, however upgrade of the pumping station will be required	1.8 km from the southern boundary
<b>Tuncurry No. 23 rising main</b> transporting wastewater to Hallidays Point WWTP	Could accept the ultimate flow, however upgrade of the pumping station will be required	200 metres from the western boundary

The following options for transportation of wastewater from the NTDP site have been investigated:

- Option 1 new NTDP WWPS and rising main transporting wastewater to the Hallidays Point WWTP.
- Option 2 new NTDP WWPS and rising main transporting flow to the Tuncurry No. 23 WWPS. The Tuncurry No. 23 WWPS would transport the existing flow and flow from the NTDP site to the Hallidays Point WWTP.
- Option 3 new NTDP WWPS and rising main transporting flow to the Tuncurry No. 23 rising main. As a result, the Tuncurry No. 23 WWPS and the new NTDP Central WWPS would pump into a common rising main.

Each of the above options has been investigated for a PWWF of 105.6 L/s (option A) and a PWWF of 66.5 L/s (option B).

The wastewater trunk main options are shown on Figure 7.

### 6.2.1 Option 1

Under Option 1 a new rising main would transport wastewater from the NTDP site to the Hallidays Point WWTP. The rising main would be approximately 11 km long located parallel to the existing Tuncurry No. 23 rising main. The main would run within the existing road easement along The Lakes Way and the access road to the Hallidays Point WWTP.

Under Option 1A (gravity sewerage reticulation system, PWWF=105.6 L/s) the rising main would be DN300. A new NTDP Central WWPS wet well would be a 3.0 metre diameter precast concrete structure, 7.5 metres deep. The wet well would accommodate two pumps (duty and stand-by) with an operating duty of 105.6 L/s at 71 metres head and an approximate motor rating of 123 kW.

Under Option 1B (vacuum sewerage reticulation system, PWWF=66.5 L/s) the rising main would be DN225. The sewage pump duty condition would be 66.5 L/s at 108 metres head. It would be difficult to establish sewage pumps in the Central Vacuum Pump Station that can deliver against a 108 metre head to the Hallidays Pont WWTP with the vacuum (negative pressure) that would exist on the pump inlet. Therefore, a new Central WWPS would be required to transport flow from the Vacuum Pump Station to the Hallidays Point WWTP.

A new Central WWPS wet well would be a 2.4 metre diameter precast concrete structure, 3.5 metres deep. The wet well would accommodate two pumps (duty and stand-by) with an operating duty of 66.5 L/s at 108 metres head and an approximate motor rating of 118 kW.

## 6.2.2 **Option 2**

Under Option 2 a new rising main would transport wastewater from the NTDP site into the Tuncurry No. 23 WWPS. The rising main would be approximately 1.8 km long located parallel to the existing Tuncurry No. 23 rising main. The main would run within the existing road easement along The Lakes Way and Grey Gum Road.

Under Option 2A (gravity sewerage reticulation system, PWWF=105.6 L/s) the rising main would be DN300. The Central WWPS wet well would be a 3.0 metre diameter precast concrete structure, 7.5 metres deep. The wet well would accommodate two pumps (duty and stand-by) with an operating duty of 105.6 L/s at 22 metres head and an approximate motor rating of 37 kW.

Under Option 2B (vacuum sewerage reticulation system, PWWF=66.5 L/s) the rising main would be DN225. A new Central WWPS would not be required as sewage pumps with an operating duty of 66.5 L/s at 21 metres head can be established in the Central Vacuum Pumping Station to transport flow to Tuncurry No. 23 WWPS - the vacuum on the pump inlet would be manageable with the modest delivery head.

Additionally, the existing pumps and discharge pipework in the Tuncurry No. 23 WWPS would have to be upgraded due to the increased flow. The existing DN450 DICL rising main transporting flow from Tuncurry No. 23 WWPS into the Hallidays Point WWTP has sufficient capacity to transport the additional peak wet weather flow (PWWF) of 105.6 L/s. It currently transports 237 L/s and after adding the flow from the NTDP site the velocity achieved in the rising main would be 1.9 m/s (Option A – gravity sewerage system) and 1.6 m/s (Option B – vacuum sewerage system). This velocity is within the normal operating velocities for the rising main and would not have any significant adverse effect on the pipeline.

## 6.2.3 Option 3

Under Option 3 a new NTDP rising main would transport wastewater from the NTDP site into the Tuncurry No. 23 rising main located west of the development site. The new rising would be approximately 650 metres long. The new NTDP Central WWPS and the Tuncurry No. 23 WWPS would pump into a common rising main.

Under Option 3A (gravity sewerage reticulation system, PWWF=105.6 L/s) the rising main would be DN300. The Central WWPS wet well would be a 4.6 metre diameter cast in-situ structure, 7 metres deep and would accommodate two pumps (duty and stand-by) with an approximate motor rating of 128 kW. The pumps would have an operating duty of 94L/s at 75 metres head when operating at the same time as the Tuncurry No. 23 WWPS and 194 L/s at 48 metres head when operating alone.

Under Option 3B (vacuum sewerage reticulation system, PWWF=66.5 L/s) the rising main would be DN225. The duty conditions for the sewage pumps would vary depending on whether the pump station operates at the same time as Tuncurry No. 23 WWPS or alone. It would be difficult to establish sewage pumps in the Central Vacuum Pump Station capable of delivering at different duties with the vacuum (negative pressure) on the pump inlet. Therefore, a new Central WWPS transporting flow from the Central Vacuum Pump Station to the Tuncurry No. 23 rising main would be required. The Central WWPS wet well would be a 3.8 metre diameter cast in-situ structure, 3 metres deep and would accommodate two pumps (duty and stand-by) with an approximate motor rating of 98 kW. The pumps would have an operating duty of 67 L/s at 62 metres head when operating at the same time as the Tuncurry No. 23 WWPS and 139 L/s at 50 metres head when operating alone.

The wet well for the new WWPS under this option is larger than the wet well under Options 1 and 2. This is due to the requirement for common pumping with the Tuncurry No. 23 WWPS. When the new NTDP Central WWPS operates at the same time as the Tuncurry No. 23 WWPS it will pump close to the design flow rate and pressure (94L/s at 75 metres head under Option 3A and 67 L/s at 62 metres head under Option 3B). However, when the new NTDP Central WWPS operates alone, the pressure in the common rising main will be lower and as a result the pumps will operate at higher flow rate (approximately at 194 L/s at 48 metres head for Option 3A and 139 L/s at 50 metres head for Option 3B). The wet well control volume will need to be sized for the highest pumping rate.

As a result of common pumping (and increased delivery head), the pump rate of the existing Tuncurry No. 23 pumps will be reduced when pumping with the new NTDP Central WWPS. (The existing Tuncurry No. 23 pump duty is 237 L/s at 58 metres head, under Option 3A the new duty would be approximately 185 L/s at 63 metres head and under Option 3B approximately 205 L/sat 61 metres head). Also, if the new duty point is close to the shut off head, the existing pumps would have to be upgraded. The specific requirements for the Tuncurry No. 23 WWPS upgrade are to be confirmed during the concept design.

## 7 OPTIONS ASSESSMENT

## 7.1 Cost Benefit Analysis

•

The preliminary capital cost estimates and net present value (NPV) analysis of the capital and operation and maintenance costs have been developed for the following options:

- Option 1 Central WWPS and rising main transporting wastewater to the Hallidays Point WWTP.
  - Option 1A gravity sewerage reticulation system.
  - Option 1B vacuum sewerage reticulation system.
- Option 2 Central WWPS and rising main transporting flow to the Tuncurry No. 23 WWPS.
  - Option 2A gravity sewerage reticulation system.
  - Option 2B vacuum sewerage reticulation system.
- Option 3 Central WWPS and rising main transporting flow to the Tuncurry No. 23 rising main.
  - Option 3A gravity sewerage reticulation system.
  - Option 3B vacuum sewerage reticulation system.

The capital cost estimates and NPV analysis of the capital and operation and maintenance costs are included in **Appendix A** and summarised in **Table 7-1**.

Table 7-1 – Capital	<b>Cost Estimates and N</b>	et Present Values of th	e Capital and O&M Costs
---------------------	-----------------------------	-------------------------	-------------------------

Option	Option A – G	ravity System	Option B – Vacuum System		
	Capital Cost	NPV at 7% over 30 years	Capital Cost	NPV at 7% over 30 years	
Option 1	\$20.8 M	\$15.1 M	\$19.3 M	\$19.0 M	
Option 2	\$17.9 M	\$12.0 M	\$16.2 M	\$15.5 M	
Option3	\$18.2 M	\$12.5 M	\$17.0 M	\$16.8 M	

Below **Table 7-2** provides a breakdown of the capital and operation and maintenance costs.

Table 7-2 – Options Capital Costs and Operation & Maintenance Costs

	Capital Cost (\$	M)					
Option	Reticulation System	Transportation System	Total	Retic.	Transport.	Odour Control	Total
Option 1A	\$16.1	\$4.8	\$20.8	\$2.7	\$1.2	\$1.4	\$4.7
Option 1B	\$15.1	\$4.1	<b>\$19.3</b>	\$15.4	\$ 1.1	\$1.4	\$17.8
Option 2A	\$16.1	\$1.8	\$17.9	\$2.7	\$0.8	\$1.4	<b>\$4.3</b>
Option 2B	\$15.1	\$1.0	\$16.2	\$15.4	\$0.1	\$1.4	\$16.8
Option 3A	\$16.1	\$2.1	\$18. <b>2</b>	\$2.7	\$1.2	\$1.4	\$4.7
Option 3B	\$15.1	\$1.9	\$17.0	\$15.4	\$1.1	\$1.4	\$17.8

Note:

- 1. The capital cost estimates within this study are based on the Hunter Water Cost Estimating Manual. Use of a common estimating framework allows for cost estimates to be compared between options, but cost estimates cannot be guaranteed as SMEC has no control over contractor's prices, market forces and competitive bids from tenderers. The cost estimates may exclude items which should be considered in a cost plan. Cost estimates are not to be relied upon in any way. If reliable cost estimates are required, then an appropriately qualified Quantity Surveyor should be engaged.
- 2. Operation and maintenance costs are based on MidCoast Water advice included in Appendix C.

Option 2B has the lowest capital cost (\$16.2M). It includes the vacuum sewerage reticulation system and trunk rising main discharging into the existing Tuncurry No.23 WWPS.

Option 2A has slightly higher capital cost (\$17.9M) than Option 2B. However, Option 2A has the lowest operation and maintenance costs (\$4.3M) and net present value (\$12M). It includes the gravity sewerage reticulation system and trunk rising main discharging into the existing Tuncurry No.23 WWPS.

Option 3B has the second lowest capital cost (\$17M).

Option 3A has the second lowest NPV (\$12.5M).

## 7.2 Non-Cost Benefit Analysis - Reticulation System

## 7.2.1 Leakage and Exfiltration

The vacuum sewer system has a lower infiltration rate during storms than the gravity system because it is designed to operate as a closed airtight and watertight system. For the same reason a vacuum sewer system is less likely than a gravity system to exfiltrate sewage to the environment. In a conventional gravity network, cracked pipes and manholes will exfiltrate sewage to the environment. In the specific case of the NTDP site, minimising exfiltration is advantageous as the site is located above extensive aquifers and in proximity to Nine Mile Beach.

## 7.2.2 Emergency Overflows

The gravity system, including the six catchment pump stations and the Central, WWPS presents a higher risk for emergency overflows than the vacuum system that includes a Central Vacuum Pump Station. During emergency situations when a pump station is inoperable for longer than the emergency storage time provided, sewage would overflow via the pump station and the lowest laying manhole cover (or via the WWPS flow relief structure if included in the design of the WWPS). These overflows may potentially lead to the transport of untreated sewage into waterways.

### 7.2.3 Dewatering

The gravity sewers would be constructed significantly deeper (up to approximately 5.5 metres deep) than the vacuum mains. It is expected that deep trenching required for the gravity mains would be undertaken in water charged ground.

Choosing vacuum sewer might not completely avoid dewatering costs. In particular the vacuum pits would be excavated to about 2.5 metres depth and may require dewatering. However, this option would require significantly less dewatering than the gravity sewer option.

There are number of construction risks associated with dewatering, examples of which include potential disruption to slope stability, potential water inrush and contamination of receiving waters.

A Dewatering Management Plan will be required during the construction. It should include an assessment of the potential geotechnical and hydrological impacts of groundwater extraction. It should demonstrate that nearby sites remain stable during and after dewatering. Details of dewatering volume, rate, duration, equipment and procedures should be included in the plan.

Works that interfere with the water table (such as continuous dewatering) require a licence under Part 5 of the Water Act 1912.

## 7.2.4 Odour

The gravity system would include a total of six vent stacks located at the rising main discharge manholes (for the six catchment pump stations) and seven vent stacks located at the seven WWPS sites (also includes the Central WWPS). The vent stacks would be located in public spaces and have the potential to release minor odour from the sewerage system. The vacuum system is designed to operate as a closed airtight and watertight system and does not require vent stacks.

## 7.2.5 Visual Impact

The vacuum system, except for the vacuum pump station, would be located underground. The gravity sewer system would include above ground pump station switchboards and vent stacks that would have a visual impact on the environment. There would be seven WWPSs with vent stacks and six rising main discharge manholes with vent stacks.

### 7.2.6 Energy Consumption

Based on the operating cost estimates detailed in **Section 7.1**, the pumps in the gravity sewer system would have lower annual energy consumption than the pumps in the vacuum sewer system.

## 7.3 Non-Cost Benefit Analysis - Transportation System

### 7.3.1 Environmental Factors

The Option 1 rising main discharging into the Hallidays Point WWTP is the longest trunk main alignment and is located mostly within a rural area. The rising main would be constructed parallel to the existing Tuncurry No. 23 rising main within the existing road easement and as a result it is expected that there would not be any significant impact on the existing environment both during and after the construction period.

The Option 2 rising main discharging into the Tuncurry No. 23 WWPS is shorter than the Option 1 rising main. However, this rising main would be constructed partly within an existing built up area and as a result there would be some impact on the local community during construction.

The Option 3 rising main has the shortest route and is located mostly within the development site. As a result, there would be minimal additional impact on the environment resulting from construction of the rising main.

In summary, Option 3 would have the least impact on the existing environment.

### 7.3.2 Impact on the Existing Wastewater Infrastructure

The Option 1 rising main would transport wastewater to the Hallidays Point WWTP. Modification to the WWTP inlet arrangement to accommodate a new rising main would be required. As a result, there would be an impact on the operation of the WWTP. However, it is expected that the modification would be of a minor scale and could be executed in a short timeframe.

The Option 2 rising main would transport flow to the Tuncurry No. 23 WWPS. Upgrade of the WWPS would be required including the construction of a new inlet, pumps and discharge pipework and an electrical upgrade.

The Option 3 rising main would transport flow to the existing Tuncurry No. 23 rising main. The connection would be undertaken in a short period of time and would not result in a significant impact on the Tuncurry No. 23 WWPS operating cycles. However, mechanical and electrical upgrade at the Tuncurry No. 23 WWPS would have to be undertaken due to pumping into a common rising main.

### 7.3.3 Construction Time

The Option 1 rising main has the longest alignment (11 km) and therefore would result in the longest construction time. The Option 2 rising main (1.8 km) and the Option 3 rising main (0.7 km) are significantly shorter and therefore would result in a significantly shorter construction time.

### 7.3.4 Opportunity for the Upgrade

Ultimately, all three options transport flow into the Hallidays Point WWTP. Option 2 and Option 3 discharge into the existing Tuncurry No. 23 WWPS and rising main. As a result the viability of Options 2 and 3, and the potential for future upgrade to these options, is dependent on (and limited by) the available capacity of the Tuncurry No. 23 WWPS and rising main.

# 8 SERVICING THE INITIAL STAGES OF THE DEVELOPMENT

The NTDP site is expected to be developed over thirty years with in excess of 25 development stages currently envisaged. The ultimate NTDP wastewater infrastructure will therefore involve considerable capital cost as well as ongoing operation and maintenance costs. Accordingly a more modest and cost effective means of servicing the development in the early years, when the number of developed lots is relatively low, has been investigated and discussed below.

### 8.1 Existing Wastewater Infrastructure

The nearest existing wastewater infrastructure is the Tuncurry No. 22 WWPS located approximately 40 metres from the southern boundary of the site. This pump station transports flow from the Great Lakes College to Tuncurry No. 23 WWPS (located 1.8 km from the NTDP southern boundary).

MidCoast Water have advised that the Tuncurry No. 22 WWPS has a spare capacity of 230 ET (gravity system basis) equal to Peak Wet Weather Flow of 9.9 L/s and could service the initial stages of the development. Refer **Appendix C**.

A vacuum sewerage system has lower stormwater infiltration than a gravity system, and therefore Tuncurry No. 22 WWPS (TU22) could service a greater number of equivalent tenements for the vacuum system. The spare capacity and theoretical flows determined for the gravity and vacuum reticulation systems are shown in **Table 8-1**.

System		ADWF	r	PDWF	SA	PWWF
	ET	L/s		L/s	L/s	L/s
Gravity	230	1.2	2.8	3.3	6.7	9.9
Vacuum	395	2.0	2.6	5.2	4.7	9.9

Table 8-1 - Sı	pare Capaci	tv in Tunc	urrv No. 22	WWPS

The following options have been identified for servicing the initial stages of the development site using the spare capacity of TU22:

- Option 1 Gravity System discharging into Tuncurry No. 22 WWPS.
- Option 2 Vacuum System discharging into Tuncurry No. 22 WWPS.

30011196 - wastewater servicing study - 2014-rev 1\_final | 30 October 2014

• Option 3 – Combined Gravity and Vacuum System discharging into Tuncurry No. 22 WWPS.

These options and the implications for staging the provision of the NTDP wastewater infrastructure are discussed below.

## 8.1.1 Option 1 - Gravity System Discharging into Tuncurry No. 22 WWPS

Based on the preliminary Master Plan shown on **Figure 2** and the current site grading plan, part of Stage A and part of Stage C (47 ET in total) could gravitate to Tuncurry No. 22 WWPS. This gravity catchment is shown on figure included in **Appendix D**.

The initial 47 ET could be developed in the first year of the development.

The theoretical flows calculated for the above ETs are summarised below in Table 8-2.

Table 8-2 – Gravity System Flow to Tuncurry No. 22 WWPS

System		ADWF	r	PDWF	SA	PWWF
	ET	L/s		L/s	L/s	L/s
Gravity	47	0.2	3.7	0.9	1.4	2.2

### 8.1.2 Option 2 - Vacuum System Discharging into Tuncurry No. 22 WWPS

Based on the preliminary Master Plan shown on **Figure 2** and the current site grading plan there is an opportunity to build a small vacuum pumping station transporting all flow from the areas of Stage A, Stage B, Stage C and possibly Stage D to the Tuncurry No. 22 WWPS, amounting to 368 ET. (The discharged PWWF would be less than the spare capacity of TU22). This catchment area is shown on figure included in **Appendix D**.

The initial 368 ET could be developed in the first five years of the development.

The theoretical flows calculated for the above scenario are summarised below in Table 8-3.

#### Table 8-3 – Vacuum System Flow to Tuncurry No. 22 WWPS

Stage	ET	<b>ADWF</b> L/s	r	<b>PDWF</b> L/s	<b>SA</b> L/s	<b>PWWF</b> L/s
А	85	0.4	3.3	1.4	1.0	2.4
В	76	0.4	3.4	1.3	0.9	2.2
С	82	0.4	3.4	1.4	1.0	2.4
D	125	0.6	3.1	2.0	1.5	3.5
Total	368	1.8		4.9	4.4	9.3 <sup>1</sup>

Note 1 - Due to the way the peaking factor (r) is calculated, calculations for PDWF and PWWF using the total 368 ET do not give the same values as adding the PDWF and PWWF values for the individual stages (A, B, C and D).

### 8.1.3 Option 3 - Combined Gravity and Vacuum System Discharging into Tuncurry No. 22 WWPS

Based on the preliminary Master Plan shown on **Figure 2** and the current site grading plan, there is an opportunity to combine a gravity system and a vacuum system. Part of Stage A and part of Stage C could be serviced via a gravity system discharging into the Tuncurry No. 22 WWPS. A small vacuum pumping station could transport flow from the remaining area of Stages A and C and the whole of Stages B and D to the Tuncurry No. 22 WWPS, amounting to 368 ET. (The discharged PWWF would be only about 0.5 L/s higher than the spare capacity). This catchment area is shown on figure included in **Appendix D**.

The initial 368 ET could be developed in the first five years of the development.

The theoretical flows calculated for the above scenario are summarised below in Table 8-4.

System		ADWF	r	PDWF	SA	PWWF
	ET	L/s		L/s	L/s	L/s
Gravity	47 <sup>1</sup>	0.2	3.7	0.9	1.4	2.2
Vacuum	321 <sup>2</sup>	1.6	2.7	4.3	3.9	8.2
Total	368					10.4

#### Table 8-4 – Combined Gravity and Vacuum Flows to Tuncurry No. 22 WWPS

Note 1 - part of Stage A and part of Stage C

Note 2 - remainder of Stages A and C, plus all of Stages B and D.

# 9 CONCLUSION

### 9.1 Reticulation System

Options for servicing the development site investigated in this report include:

- Option A gravity reticulation sewerage system; and
- Option B vacuum reticulation sewerage system.

Option B (vacuum reticulation system) has a lower capital cost and potential environmental impact than Option A (gravity reticulation system).

However, Option A has significantly lower operating and maintenance costs and a lower net present value (refer Table 7-1). It is considered that the potential environmental impacts of the gravity system could be minimised during design and construction (e.g. allowing for a larger WWPS emergency storage, targeting high quality construction, providing sufficient cover to the reticulation pipes to minimise movement and cracking, etc.)

As a result, it is considered that a gravity reticulation sewerage system is preferable for the North Tuncurry site.

### 9.2 Transportation System

The following options for transporting wastewater from the NTDP site have been investigated:

• Option 1 – new NTDP WWPS and rising main transporting wastewater to the Hallidays Point WWTP.

- Option 2 new NTDP WWPS and rising main transporting wastewater to the Tuncurry No. 23 WWPS. The Tuncurry No. 23 WWPS would transport the existing flow and flow from the NTDP site to the Hallidays Point WWTP.
- Option 3 new NTDP WWPS and rising main transporting flow to the Tuncurry No. 23 rising main. As a result, the Tuncurry No. 23 WWPS and the new NTDP Central WWPS would pump into a common rising main.

The Option 2 NTDP rising main discharging into the Tuncurry No. 23 WWPS has the lowest capital cost, operation and maintenance costs and NPV. It would have some impact on the local community during the construction phase and on the existing Tuncurry No. 23 WWPS during operation. The impact can be minimised by selecting trenchless technology for construction of the new NTDP rising main road crossings. The specific requirements for upgrading the Tuncurry No. 23 WWPS are to be further investigated during the concept design stage.

Option 1B

Vacuum Sewerage Reticulation System

Note: Under this option the Vacuum Pumping Station would not be able to transport wastewater to Hallidays Point WWTP and Central WWPS and RM would be required.

Option 3B

Vacuum Sewerage Reticulation System

Note: Under this option the Vacuum Pumping Station would not be able to transport wastewater to common rising main and therefore Central WWPS and RM would be required.

### Sewer Pipeline - Gravity - section will be present if one or more gravity mains are specified

ltem	Construction of Sewer Gravity Mains	Qty	Unit	Rate \$/Unit	Amount \$
HWG001	Service Location	Item	Lump Sum	\$ 279.00	\$ 279.00
HWG002	Supply all valves	Item	Lump Sum		\$-
HWG003	Supply all fittings	Item	Lump Sum		\$-
HWG004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:				
00FVSS	Nominal DN150 PVC pipe	265	m	\$ 12.00	\$ 3,180.00
01EVSS	Nominal DN300 PVC pipe	160	m	\$ 68.00	\$ 10,880.00
HWG005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.				
00FV03	Nominal DN150 PVC (Trench type 3)	265	m	\$ 85.40	\$ 22,631.00
HWG006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m depth to invert in OTR				
01EV03	Nominal DN300 PVC (Trench type 3)	160	m	\$ 181.75	\$ 29,080.00
HWG007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m depth to invert in OTR				
HWG008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m depth to invert in OTR				
HWG009	Excavate, backfill, supply and install access chambers including base, chamber, cover & surround and access ladder for the following nominal diameter access chambers:				
HWG010	Extra over rate for installation for Additional compaction		m3	\$ 38.25	

HWG011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 78.75	
HWG012	Extra over rate for installation to supply, place & compact non cohesive material.		m3		
HWG013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 337.50	
HWG014	Extra over rate for installation for Supply, place and compact aggregate		m3		
HWG015	Supply & place ballast		tonnes	\$ 90.00	
HWG016	External Dewatering of trench including establishment & disestablishment	160	m3	\$ 7.19	\$ 1,150.00
HWG017	Supply and place treated timber piling for pipe support		m		
HWG018	Road / creek crossings				
HWG019	Extra over rate for installation of trenchless technique under existing rail line		m		
HWG020	Supply & installation of river crossing includes supply of MSCL pipe, welding, testing of welds, 150mm concrete encasement, mobilisation & demobilisation of dredge, excavation & disposal of excavated material, backfilling, lay, bed & test:				
HWG021	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:				
HWG022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206		Each		
HWG023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWG024	Flow Relief Structures		Each		
HWG025	EMPTY				
HWG026	Supply and construct vent stacks		each		
HWG027	Preparation of line sheets	425	each	\$ 1.00	\$ 425.00
HWG028	Acceptance testing - gravity main		m		
HWG029	Miscellaneous				
HWG000	Sub Total				\$67,625

#### Sewer Pipeline - Gravity - section will be present if one or more gravity mains are specified

Item	Construction of Sewer Gravity Mains	Qty	Unit	Rate \$/Unit	Amount \$
HWG001	Service Location	Item	Lump Sum	\$ 736.50	\$ 736.50
HWG002	Supply all valves	Item	Lump Sum		\$-
HWG003	Supply all fittings	Item	Lump Sum		\$-
HWG004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:				
00FVSS	Nominal DN150 PVC pipe	940	m	\$ 12.00	\$ 11,280.00
01EVSS	Nominal DN300 PVC pipe	230	m	\$ 68.00	\$ 15,640.00
HWG005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.				
00FV03	Nominal DN150 PVC (Trench type 3)	940	m	\$ 85.40	\$ 80,276.00
01EV03	Nominal DN300 PVC (Trench type 3)	230	m	\$ 108.25	\$ 24,897.50
HWG006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m depth to invert in OTR				
HWG007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m depth to invert in OTR				
HWG008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m depth to invert in OTR				
HWG009	Excavate, backfill, supply and install access chambers including base, chamber, cover & surround and access ladder for the following nominal diameter access chambers:				
HWG010	Extra over rate for installation for Additional compaction		m3	\$ 19.13	

HWG011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 78.75	
HWG012	Extra over rate for installation to supply, place & compact non cohesive material.		m3		
HWG013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 337.50	
HWG014	Extra over rate for installation for Supply, place and compact aggregate		m3		
HWG015	Supply & place ballast		tonnes	\$ 90.00	
HWG016	External Dewatering of trench including establishment & disestablishment		m3		
HWG017	Supply and place treated timber piling for pipe support		m		
HWG018	Road / creek crossings				
HWG019	Extra over rate for installation of trenchless technique under existing rail line		m		
HWG020	Supply & installation of river crossing includes supply of MSCL pipe, welding, testing of welds, 150mm concrete encasement, mobilisation & demobilisation of dredge, excavation & disposal of excavated material, backfilling, lay, bed & test:				
HWG021	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:				
HWG022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206		Each		
HWG023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWG024	Flow Relief Structures		Each		
HWG025	EMPTY				
HWG026	Supply and construct vent stacks		each		
HWG027	Preparation of line sheets	1170	each	\$ 1.00	\$ 1,170.00
HWG028	Acceptance testing - gravity main		m		
HWG029	Miscellaneous				
HWG000	Sub Total				\$134,000

Item No.	Item Description	Qty	Unit		Amount

HW0008	Community Consultation	ltem	Lump Sum	\$ -	\$ -

#### Sewer Pipeline - Rising - section will be present if one or more rising mains are specified

Item	Construction of Sewer Rising Mains	Qtv	Unit	Rate \$/Unit		Amount \$	
HWR001	Service Location			\$	294.00	\$	294.00
		Item	Lump Sum			÷	
HWR002	Supply all valves	Item	Lump Sum			\$	-
HWR003	Supply all fittings	ltem	Lump Sum			\$	-
HWR004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:						
10FVSS	Nominal DN150 PVC pipe	490	m	\$	28.00	\$	13,720.00
HWR005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.						
10FV03	Nominal DN150 PVC (Trench type 3)	490	m	\$	67.40	\$	33,026.00
HWR006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m to invert in OTR.						
HWR007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m to invert in OTR.						
HWR008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m to invert in OTR.						
HWR009	EMPTY						
HWR010	Extra over rate for installation for Additional compaction		m3	\$	15.30		
HWR011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$	63.00		
HWR012	Extra over rate for installation to Supply & place & compact non cohesive material.		m3				
HWR013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$	270.00		
HWR014	Extra over rate for installation for Supply, place and compact aggregate		m3				
HWR015	Supply & place ballast		tonnes	\$	90.00		
HWR016	External Dewatering of trench including establishment & disestablishment		m				
HWR017	Supply and place treated timber piling for pipe support		m				
HWR018	Road / creek crossings						
HWR019	Extra over rate for installation of trenchless technique under existing rail line		m				
HWR020	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:						

HWR021	Supply and installation of pipe river crossing including supply of MSCL pipe, internal and external welding, testing of welds and 150 thick concrete encasement. Also includes mobilisation and demobilisation of dredge(if required) excavation & disposal of excavated material, backfilling, lay, bed and test for the following MSCL pipe sizes:				
HWR022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206	ltem	Lump Sum		\$ -
HWR023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWR024	Flow Relief Structures		Each		
HWR025	EMPTY				
HWR026	Supply and construct vent stacks	1	each	\$ 9,500.00	\$ 9,500.00
HWR027	Preparation of line sheets	490	m	\$ 1.00	\$ 490.00
HWR028	Acceptance testing - rising main		m		
HWR029	Miscellaneous				
HWR000	Sub Total				\$57,030

PS3

Item	Pump Station - Name	Qty	Unit	Rate \$/Unit	Amount \$

#### Sewer Pipeline - Rising - section will be present if one or more rising mains are specified

Item	Construction of Sewer Rising Mains	Qty	Unit	Rate \$/Unit	Amount \$
HWR001	Service Location	ltem	Lump Sum	\$ 150.00	\$ 150.00
HWR002	Supply all valves	ltem	Lump Sum		\$ -
HWR003	Supply all fittings	ltem	Lump Sum		\$ -
HWR004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:				
10FVSS	Nominal DN150 PVC pipe	250	m	\$ 28.00	\$ 7,000.00
HWR005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.				
10FV03	Nominal DN150 PVC (Trench type 3)	250	m	\$ 67.40	\$ 16,850.00
HWR006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m to invert in OTR.				
HWR007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m to invert in OTR.				
HWR008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m to invert in OTR.				
HWR009	EMPTY				
HWR010	Extra over rate for installation for Additional compaction		m3	\$ 15.30	
HWR011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 63.00	
HWR012	Extra over rate for installation to Supply & place & compact non cohesive material.		m3		
HWR013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 270.00	
HWR014	Extra over rate for installation for Supply, place and compact aggregate		m3		
HWR015	Supply & place ballast		tonnes	\$ 90.00	
HWR016	External Dewatering of trench including establishment & disestablishment		m		
HWR017	Supply and place treated timber piling for pipe support		m		
HWR018	Road / creek crossings				
HWR019	Extra over rate for installation of trenchless technique under existing rail line		m		
HWR020	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:				
HWR021	Supply and installation of pipe river crossing including supply of MSCL pipe, internal and external welding, testing of welds and 150 thick concrete encasement. Also includes mobilisation and demobilisation of dredge(if				
--------	---	------	----------	----------------	----------------
	required) excavation & disposal of excavated material, backfilling, lay, bed and test for the following MSCL pipe sizes:				
HWR022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206	ltem	Lump Sum		\$ -
HWR023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWR024	Flow Relief Structures		Each		
HWR025	EMPTY				
HWR026	Supply and construct vent stacks	1	each	\$ 9,500.00	\$ 9,500.00
HWR027	Preparation of line sheets	250	m	\$ 1.00	\$ 250.00
HWR028	Acceptance testing - rising main		m		
HWR029	Miscellaneous

### Sewer Pipeline - Rising - section will be present if one or more rising mains are specified

Item	Construction of Sewer Rising Mains	Qty	Unit	Rate \$/Unit	Amount \$
HWR001	Service Location	ltem	Lump Sum	\$ 336.00	\$ 336.00
HWR002	Supply all valves	ltem	Lump Sum		\$ -
HWR003	Supply all fittings	Item	Lump Sum		\$ -
HWR004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:				
108ESS	Nominal DN80 PE pipe	560	m	\$ 19.00	\$ 10,640.00
HWR005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.				
1.08E+05	Nominal DN80 PE (Trench type 3)	560	m	\$ 69.40	\$ 38,864.00
HWR006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m to invert in OTR.				
HWR007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m to invert in OTR.				
HWR008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m to invert in OTR.				
HWR009	EMPTY				
HWR010	Extra over rate for installation for Additional compaction		m3	\$ 15.30	
HWR011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 63.00	
HWR012	Extra over rate for installation to Supply & place & compact non cohesive material.		m3		
HWR013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 270.00	
HWR014	Extra over rate for installation for Supply, place and compact aggregate		m3		
HWR015	Supply & place ballast		tonnes	\$ 90.00	
HWR016	External Dewatering of trench including establishment & disestablishment		m		
HWR017	Supply and place treated timber piling for pipe support		m		
HWR018	Road / creek crossings				
HWR019	Extra over rate for installation of trenchless technique under existing rail line		m		
HWR020	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:				

HWR021	Supply and installation of pipe river crossing including supply of MSCL pipe, internal and external welding, testing of welds and 150 thick concrete encasement. Also includes mobilisation and demobilisation of dredge(if required) excavation & disposal of excavated material, backfilling, lay, bed and test for the following MSCL pipe sizes:				
HWR022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206	ltem	Lump Sum		\$ -
HWR023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWR024	Flow Relief Structures		Each		
HWR025	EMPTY				
HWR026	Supply and construct vent stacks	1	each	\$ 9,500.00	\$ 9,500.00
HWR027	Preparation of line sheets	560	m	\$ 1.00	\$ 560.00
HWR028	Acceptance testing - rising main		m		
HWR029	Miscellaneous				
HWR000	Sub Total				\$59,900

### Sewer Pipeline - Rising - section will be present if one or more rising mains are specified

ltem	Construction of Sewer Rising Mains	Qtv	Unit	Rate \$/Unit		Amount \$
HWR001	Service Location			\$ 288.00	\$	288.00
		Item	Lump Sum		<u>,</u>	
HWR002	Supply all valves	Item	Lump Sum		\$	-
HWR003	Supply all fittings	ltem	Lump Sum		\$	-
HWR004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:					
108ESS	Nominal DN80 PE pipe	480	m	\$ 19.00	\$	9,120.00
HWR005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.					
1.08E+05	Nominal DN80 PE (Trench type 3)	480	m	\$ 69.40	\$	33,312.00
HWR006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m to invert in OTR.					
HWR007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m to invert in OTR.					
HWR008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m to invert in OTR.					
HWR009	EMPTY					
HWR010	Extra over rate for installation for Additional compaction		m3	\$ 15.30		
HWR011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 63.00		
HWR012	Extra over rate for installation to Supply & place & compact non cohesive material.		m3			
HWR013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 270.00		
HWR014	Extra over rate for installation for Supply, place and compact aggregate		m3			
HWR015	Supply & place ballast		tonnes	\$ 90.00		
HWR016	External Dewatering of trench including establishment & disestablishment		m			
HWR017	Supply and place treated timber piling for pipe support		m			
HWR018	Road / creek crossings					
HWR019	Extra over rate for installation of trenchless technique under existing rail line		m			
HWR020	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:					

HWR021	Supply and installation of pipe river crossing including supply of MSCL pipe, internal and external welding, testing of welds and 150 thick concrete encasement. Also includes mobilisation and demobilisation of dredge(if required) excavation & disposal of excavated material, backfilling, lay, bed and test for the following MSCL pipe sizes:				
HWR022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206	ltem	Lump Sum		\$ -
HWR023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWR024	Flow Relief Structures		Each		
HWR025	EMPTY				
HWR026	Supply and construct vent stacks	1	each	\$ 9,500.00	\$ 9,500.00
HWR027	Preparation of line sheets	480	m	\$ 1.00	\$ 480.00
HWR028	Acceptance testing - rising main		m		
HWR029	Miscellaneous				
HWR000	Sub Total				\$52,700

HW0008	Community Consultation	Item	Lump Sum	\$ -	\$ -

### Sewer Pipeline - Rising - section will be present if one or more rising mains are specified

Item	Construction of Sewer Rising Mains	Qty	Unit	Rate \$/Unit	Amount \$
HWR001	Service Location	ltem	Lump Sum	\$ 384.00	\$ 384.00
HWR002	Supply all valves	ltem	Lump Sum		\$ -
HWR003	Supply all fittings	ltem	Lump Sum		\$ -
HWR004	Supply all pipe materials including detector tape, pipe protection wrapping, rubber rings and lubricant for following pipe sizes:				
108ESS	Nominal DN80 PE pipe	640	m	\$ 19.00	\$ 12,160.00
HWR005	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Up to 1.5 m depth to invert in OTR.				
1.08E+05	Nominal DN80 PE (Trench type 3)	640	m	\$ 69.40	\$ 44,416.00
HWR006	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >1.5m to 3.0m to invert in OTR.				
HWR007	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >3.0m to 4.5m to invert in OTR.				
HWR008	Clear, excavate, lay, join, bed, backfill & test pipelines (installation). Nominal depth >4.5m to invert in OTR.				
HWR009	EMPTY				
HWR010	Extra over rate for installation for Additional compaction		m3	\$ 15.30	
HWR011	Excavate below specified design depth where directed including disposal of excess excavated material		m3	\$ 63.00	
HWR012	Extra over rate for installation to Supply & place & compact non cohesive material.		m3		
HWR013	Extra over rate for installation for supply, place and compact stabilised sand cement (14:1) backfill		m3	\$ 270.00	
HWR014	Extra over rate for installation for Supply, place and compact aggregate		m3		
HWR015	Supply & place ballast		tonnes	\$ 90.00	
HWR016	External Dewatering of trench including establishment & disestablishment		m		
HWR017	Supply and place treated timber piling for pipe support		m		
HWR018	Road / creek crossings				
HWR019	Extra over rate for installation of trenchless technique under existing rail line		m		
HWR020	Supply and installation of pipe aerial creek crossing including supply of MSCL pipe with protection coating, internal and external welding, testing of welds. For the following MSCL pipe sizes:				

HWR021	Supply and installation of pipe river crossing including supply of MSCL pipe, internal and external welding, testing of welds and 150 thick concrete encasement. Also includes mobilisation and demobilisation of dredge(if				
	required) excavation & disposal of excavated material, backfilling, lay, bed and test for the following MSCL pipe sizes:				
HWR022	Bulkheads and Trenchstops in accordance with WSAA drawing SEW-1206	ltem	Lump Sum		\$ -
HWR023	Supply and Install valve pits (excluding valves and fittings)	0	Each	\$ -	\$ -
HWR024	Flow Relief Structures		Each		
HWR025	EMPTY				
HWR026	Supply and construct vent stacks	1	each	\$ 9,500.00	\$ 9,500.00
HWR027	Preparation of line sheets	640	m	\$ 1.00	\$ 640.00
HWR028	Acceptance testing - rising main		m		
HWR029	Miscellaneous				
HWR000	Sub Total				\$67,100

Subject:	RE: North Tuncurry Development Project - Water and Wastewater Servicing	
	Strategies	

#### Hi Marketa,

I would confirm that I met with Michael Pring on the same day as your email. Our answers to your questions follow:

- A plan of the gravity system is shown in the sketch below. Gravity sewers are dark green, sewer rising mains in red.
- The connection point would be the stub sewer provided out of Sewerage Pump Station TU22, located within the Great Lakes Education Campus. The system capacity nominally is about 300ET, so after the Great Lakes Education campus (70 ET) is catered for, it could accommodate a further 230 ET. The pump station itself has a generous volume, but the limitation would be the 150mm receiving sewer in Douglas Avenue. Any upgraded pumping arrangements after that would be recommended to be pumped past TU06 direct to Tuncurry's main sewerage pump station, SPS TU23.
- The existing gravity sewer level is nominally about 4 metres deep, and should be confirmed by survey. The potential sewer catchment area for this sewer pump station would depend on final fill levels for the development, since the site is relatively flat and will be re-graded during development. I believe this is to be resolved with local surveyors Lidbury Summers Whiteman.
- There is an existing 250mm water main located in The Northern Parkway, which would be satisfactory for a first stage up to the limit of the sewer capacity mentioned above. Given the size of the North Tuncurry Development Project our long term expectation is that the development be fed by at least two water main connections.
- Recycled water mains are also available in this vicinity. The recycled water undergoes membrane microfiltration and is suitable for unrestricted use in public open spaces. A modest treatment upgrade would probably be required for residential use to meet the Australian Recycled Water Guidelines.

Cheers,

Subject: North Tuncurry Development Project - Water and Wastewater Servicing Strategies

Hi Brendan,

This is regarding the North Tuncurry Development Project. I am working on the Water and Wastewater Servicing Strategies for the development and was wondering if you could provide me some additional information.

In your comments on the strategies (letter of 6<sup>th</sup> September 2013) and previous discussions with SMEC you mentioned possibility to negotiate connections of the early stages of the development. It is understood that there may be potential to connect some southern portions of the development to the existing gravity sewer system.

We would like to investigate this option and I was wondering if you could provide me the following:

- A plan showing the existing gravity sewer system.
- Potential connection point, existing sewer invert levels at this point.
- Available capacity in the sewer system.

Could you please also advise us on the following:

- If there is an opportunity to connect the southern portions of the development to existing sewer system, would there be also an opportunity to supply the southern portions from the existing nearby water main.

Thank you,

Marketa McCarthy

Subject:	RE: North Tuncurry Development Project - Water and Wastewater Servicing
	Strategies

Hi Marketa.

Arguably, yes you could squeeze in some more ET's based on your suggestion.

Our current recommendation however is to make use of the existing gravity sewer pump station rather than incur the high up-front cost of a new pump station (even if it is a 'temporary' or 'skid mounted' vacuum pump station). Now that a layout and indicative staging plan has been provided, MidCoast Water can provide a bit more information on scope and indicative cost of a vacuum pump station that would address MCW requirements. We would need about a further week to do so.

Regards,

Brendan

Subject: RE: North Tuncurry Development Project - Water and Wastewater Servicing Strategies

Hi Brendan,

Thank you for your email.

I just was wondering, would it be possible to discharge into the SPS TU22 more ETs if we use vacuum sewer reticulation system?

The below tables show, that 230 ET will result in PWWF of 9.9 L/s when conveyed via conventional gravity sewer system and PWWF of 6 L/s when conveyed via vacuum sewer system (lower storm allowance). The vacuum sewers could convey 395 ET with PWWF of 9.9 L/s.

#### Gravity

ET	ADWF	PDWF	SA	PWWF
	L/s	L/s	L/s	L/s
230	1.15	3.3	6.67	9.94

## Vacuum

ET	ADWF	PDWF	SA	PWWF
	L/s	L/s	L/s	L/s
230	1.15	3.3	2.76	6.0
395	1.975	5.2	4.74	9.91

Please could you provide us your advice.

Thank you,

Marketa

Subject:	RE: North Tuncurry Development Project - Indicative O&M's

Marketa,

I've attached a table of indicative O&M costs for various asset classes.

Sewerage Pump Station Maintenance	2.25% Capital Cost PA
Gravity Sewerage Reticulation Mains Maintenance	0.75% Capital Cost PA
Gravity Sewerage Truck Mains Maintenance	0.50% Capital Cost PA
Sewerage Rising Main Maintenance	0.25% Capital Cost PA
Pressure Sewerage Network Maintenance	0.25% Capital Cost PA (excludes pressure unit maintenance)
Vacuum Sewerage Pump Station Maintenance	7.75% Capital Value PA
Vacuum Reticulation Network Maintenance	5.00% Capital Value PA (includes vac valve & pit)

BG,

Note the vacuum numbers look way too high but are not a mistake, they are based upon our analysis at Harrington as described below:

Pump station O&M tending to 90K per annum (around \$200 per property) - assetic value for HR09 just under 1M, then I have assumed we can draw down the O&M with modern design.

Vac Retic O&M at Harrington trending the 50k per annum (around \$100 per property). I have assumed 5 properties (average) per pit, with valve, pit & associated vac retic of estimated value \$8,500 per 5 properties, again drawing down the % slightly for better design.

Regards,

David McKellar Development Engineer

Hi David,

I am just following up on our previous conversation regarding the North Tuncurry Development Project.

Could you please let me know how you are going with the gravity and vacuum sewers maintenance costs estimates and if you need anything from us?

Thank you,

Marketa

**Dear Michael** 

### Water and Sewerage Development Standards

I confirm that Council's development standards for water and sewerage have not changed since we commenced discussing the project in 2011.

Yours sincerely

Brendan Guiney Director Water Services
